13th International GEMS workshop
Seoul, November 9, 2022

S4 NO₂ breadboard algorithm

Mission

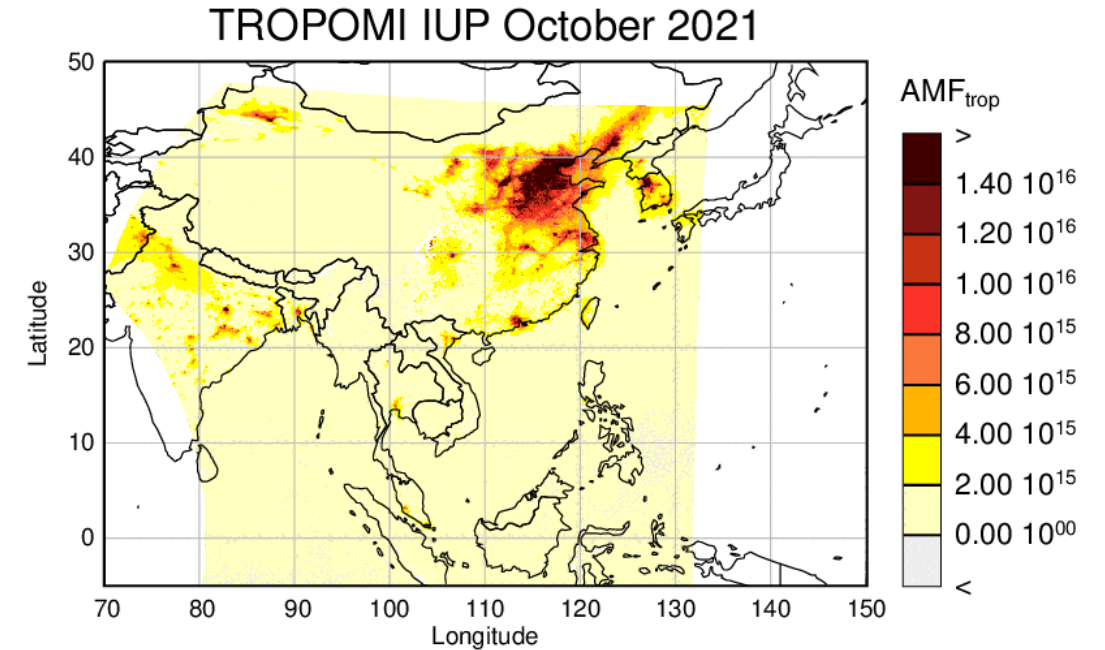

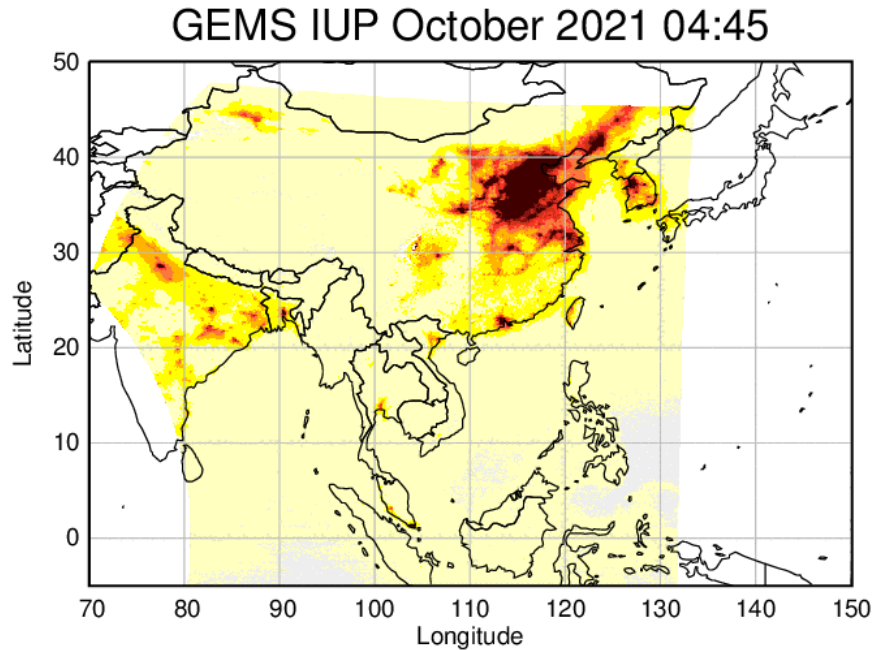

- Sentinel 4 is the European geostationary satellite
- Launch 2024, coverage Europe

S4 NO₂ Algorithm

- DOAS NO₂ retrieval
- 405 – 485 nm
- Stratosphere from STREAM (Beirle et al., 2016)
- NO₂ *a priori* from TM5
- OMI surface reflectivity
- Cloud correction using lv2 cloud data
- No aerosols
- No BRDF

=> Idea: Test algorithms on GEMS data

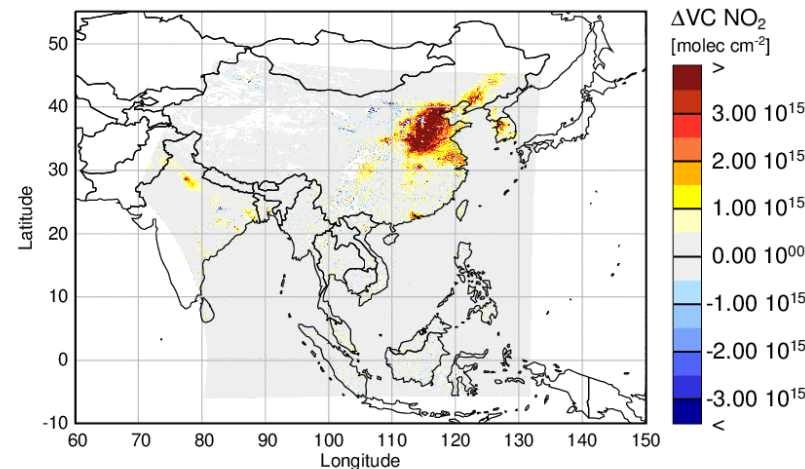

- Very similar patterns
- Very similar NO₂ levels
- But is that really good agreement?
 - GEMS overestimation
 - Significant scatter

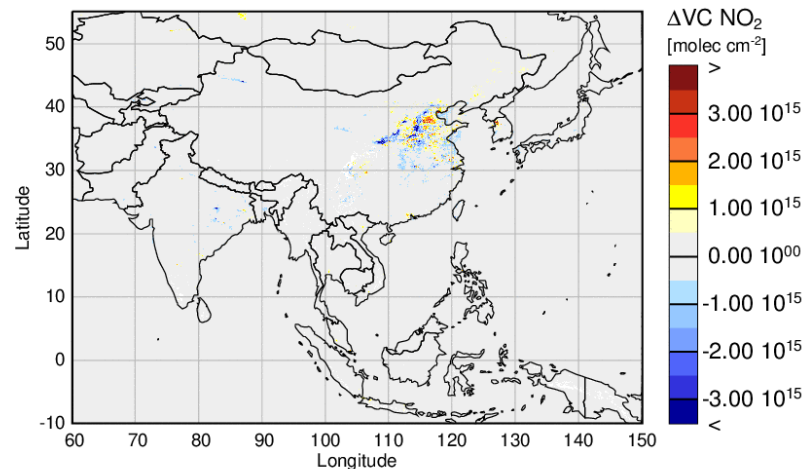

Why no better agreement with TROPOMI?

- Slant column fit: similar
- Stratospheric correction: similar approach
- Surface reflectance: same climatology
- Atmospheric profiles: both from TM5
- Clouds:
 - TROPOMI: FRESCO wide + cloud fraction from NO₂ lv2 file
 - GEMS: O2-O2 from GEMS cloud lv2 file

GEMS IUP October 2021 04:45: effect of cloud correction

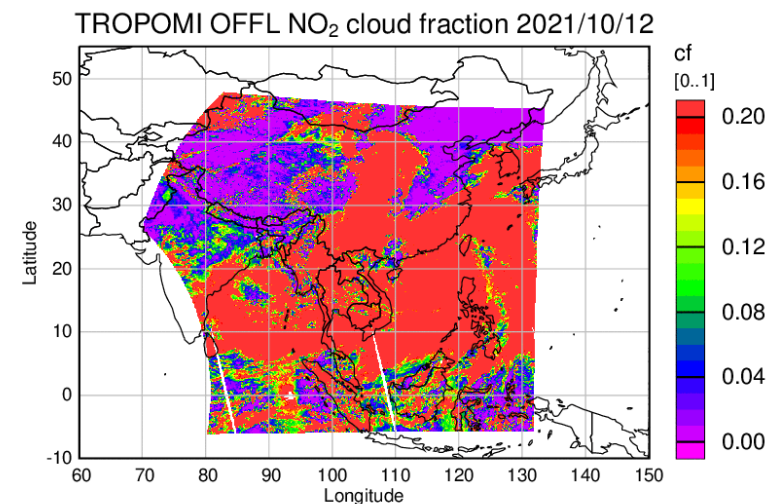

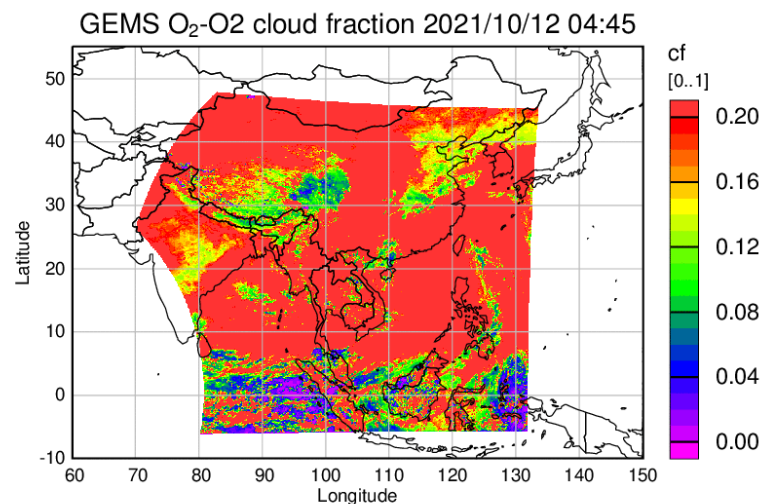

TROPOMI IUP October 2021: effect of cloud correction

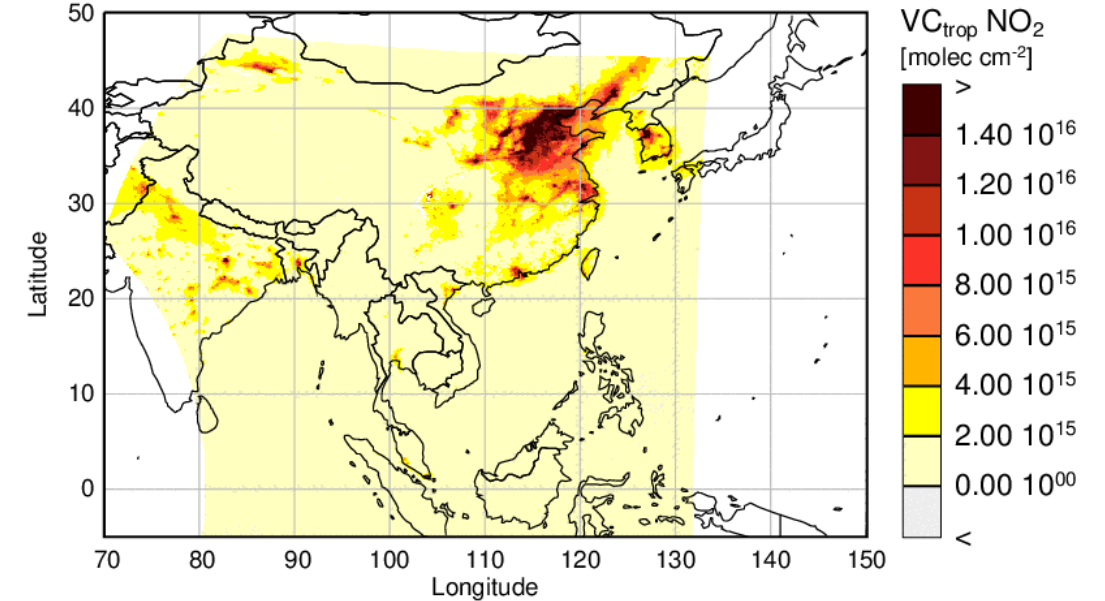

Why no better agreement with TROPOMI?

- Slant column fit: similar
- Stratospheric correction: similar approach
- Surface reflectance: same climatology
- Atmospheric profiles: both from TM5
- Clouds:
 - TROPOMI: FRESCO wide + cloud fraction from NO₂ lv2 file
 - GEMS: O2-O2 from GEMS cloud lv2 file

GEMS IUP October 2021 04:45, no cloud correction TROPOMI IUP October 2021, no cloud correction

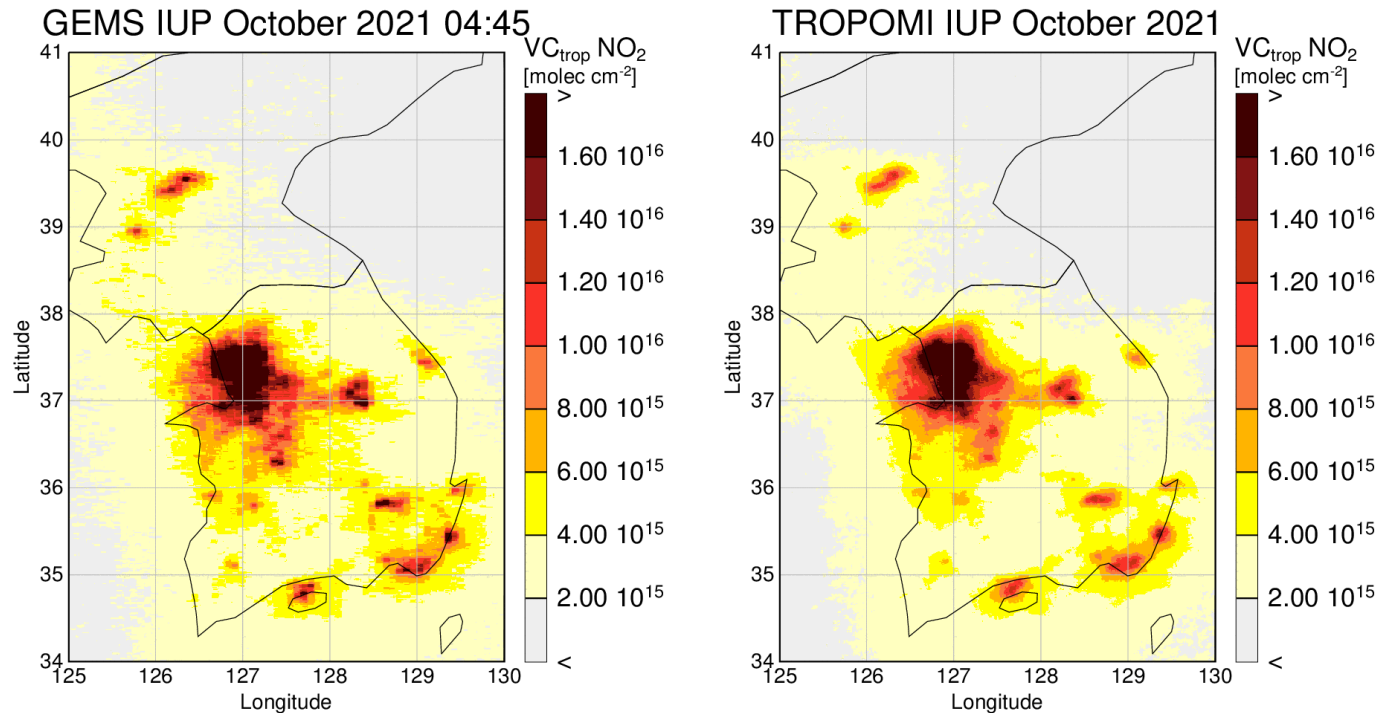

- Cloud correction switched off
- Only using filtering on cloud radiance fraction:
 - TROPOMI: $\leq 50\%$ CRF
 - GEMS: $\leq 60\%$ CRF

A few percent GEMS overestimation remain

Oversampling

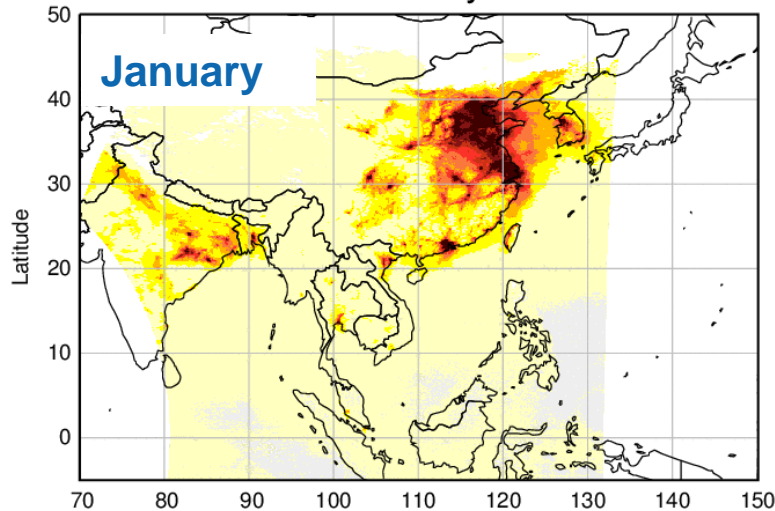

Data was sampled at
0.01° resolution

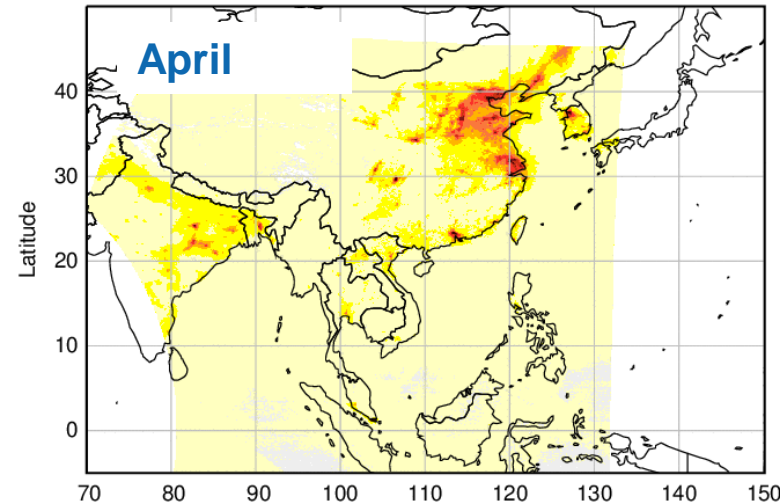

- Sampling pattern remains visible in GEMS averages
- Less smoothing, no oversampling

GEMS tropospheric NO₂ examples

GEMS IUP January 2021 04:45

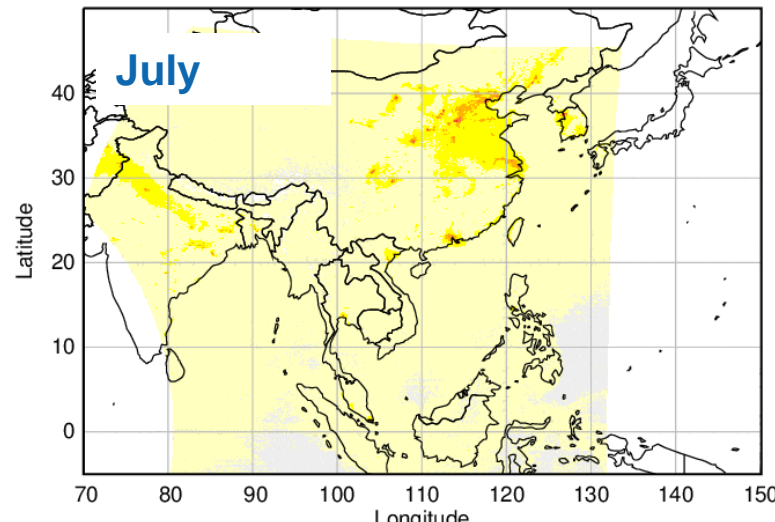

GEMS IUP April 2021 04:45

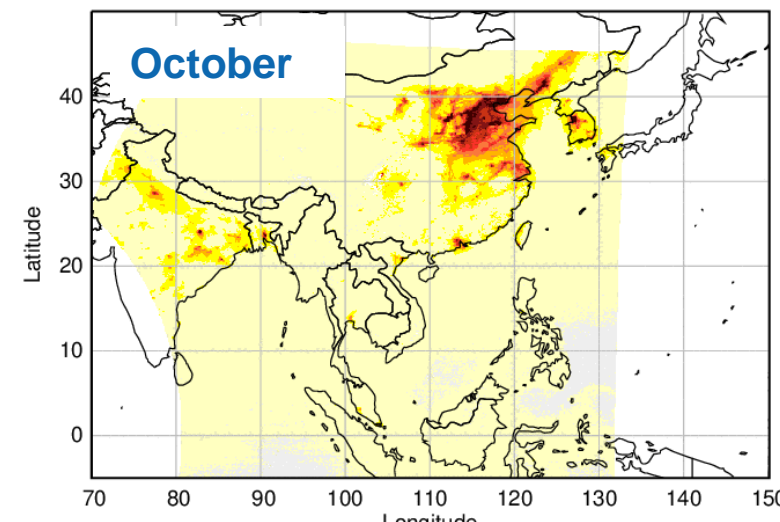

- S4 algorithm
- Monthly average
- @ 04:45 UTC

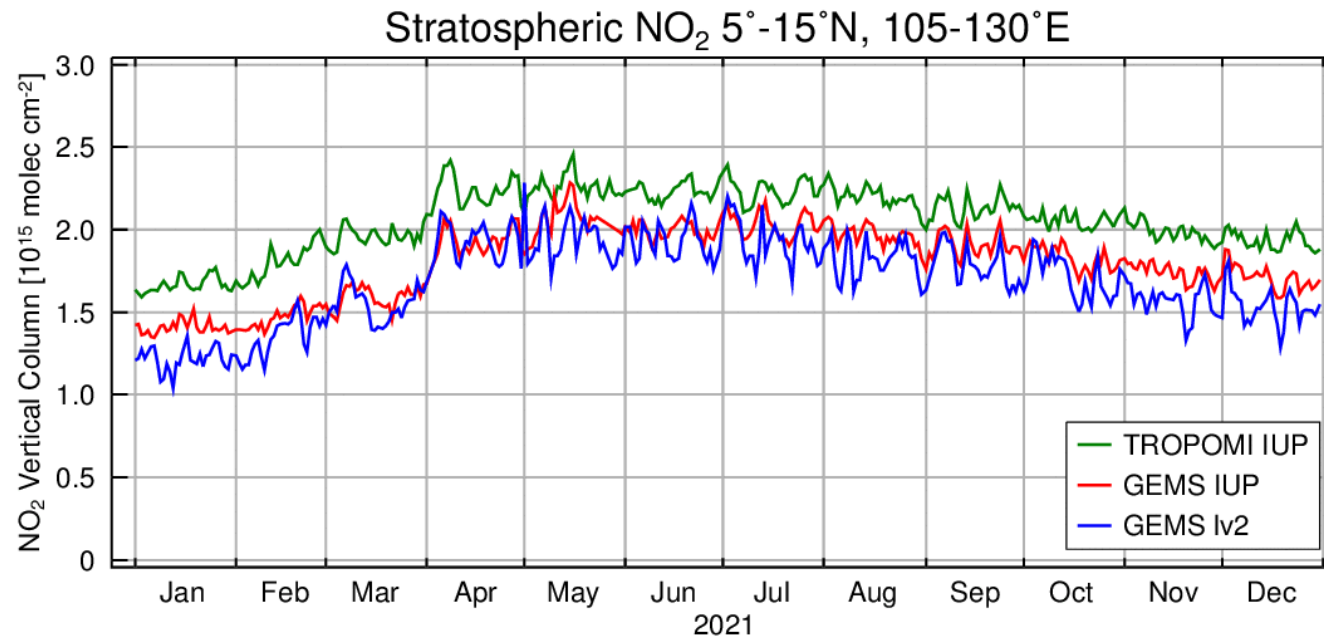

GEMS IUP July 2021 04:45

GEMS IUP October 2021 04:45

How stable is GEMS NO₂?

One year of data over relatively unpolluted region

Only 04:45 UTC data used from GEMS

Stratospheric AMF applied to slant columns

=> good agreement, small offset to TROPOMI, more noise in lv2 data

How stable is GEMS NO₂?

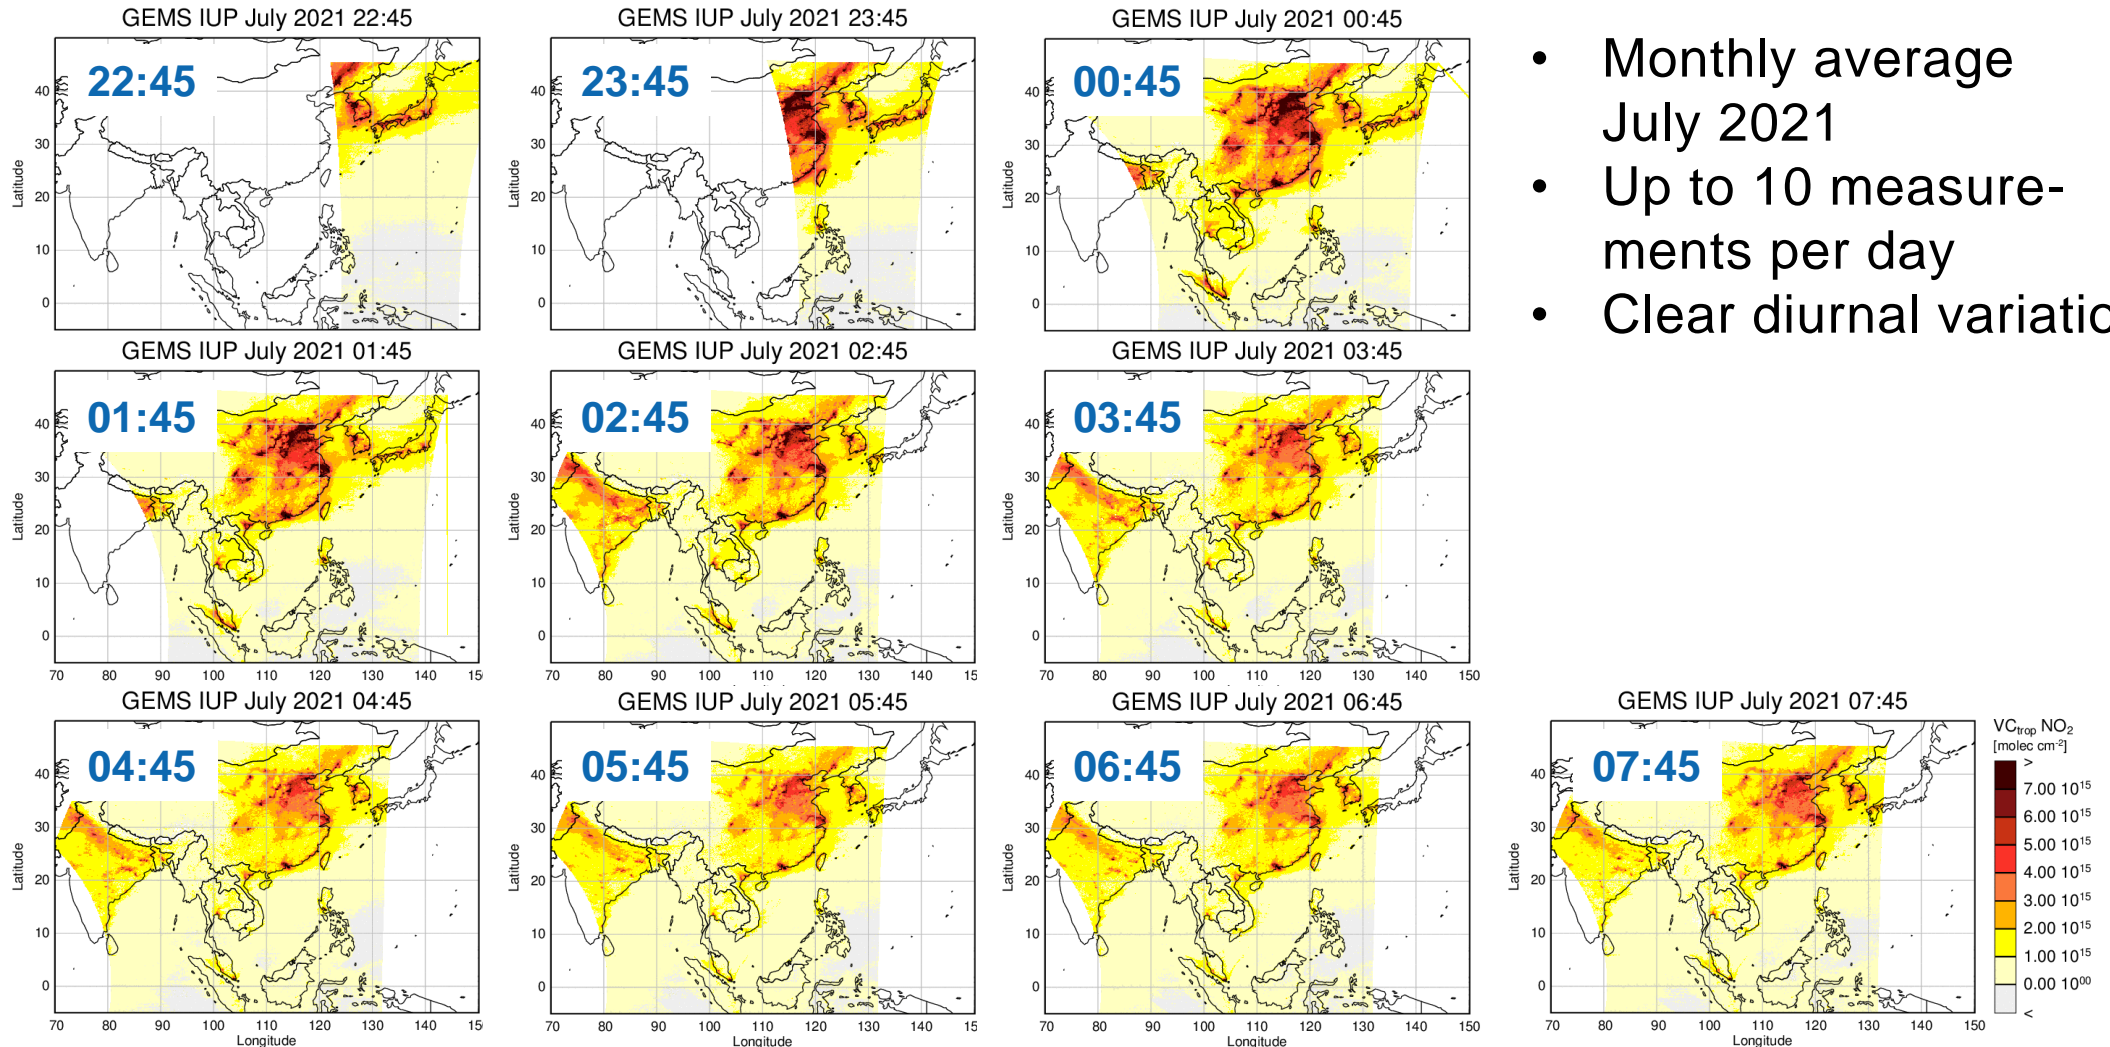

- Difference between GEMS and TROPOMI is small (2–3×10¹⁴ molec cm⁻²)
- Variations until May 10, constant afterwards

How stable is GEMS NO₂?

- Evaluation of fitting RMS for 04:45 UTC
 - Very constant over time with daily irradiance
 - Increase in RMS with fixed irradiance until May 10, constant afterwards
- => something changed in the instrument, operation or lv1 data

GEMS NO₂ diurnal variation

GEMS tropospheric NO₂ diurnal variation

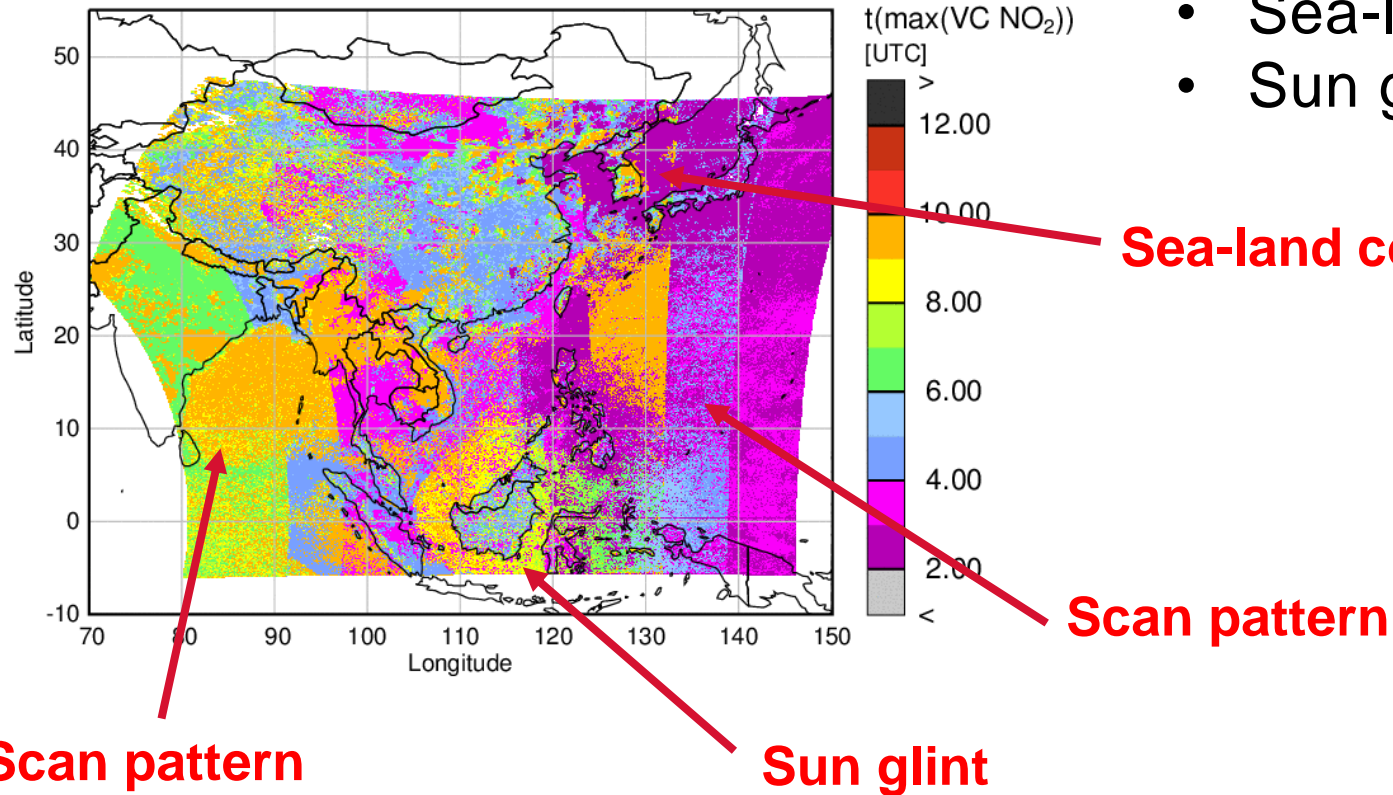

- Smooth diurnal variations
- Depend on location
- Depend on season
- Times are UTC
- Coverage depends on position in GEMS FOV
- Less measurements in winter

Time of NO₂ maximum

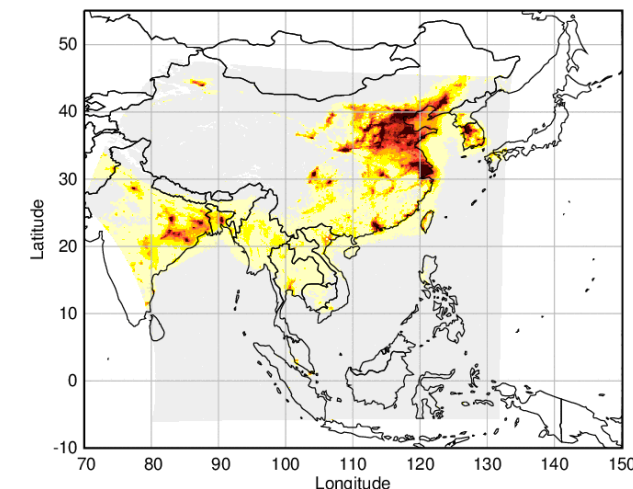

- GEMS scan pattern can be seen
- Sea-land contrast
- Sun glint

GEMS IUP March 2024: time of maximum NO₂

Not seen

GEMS IUP March 2021 04:45

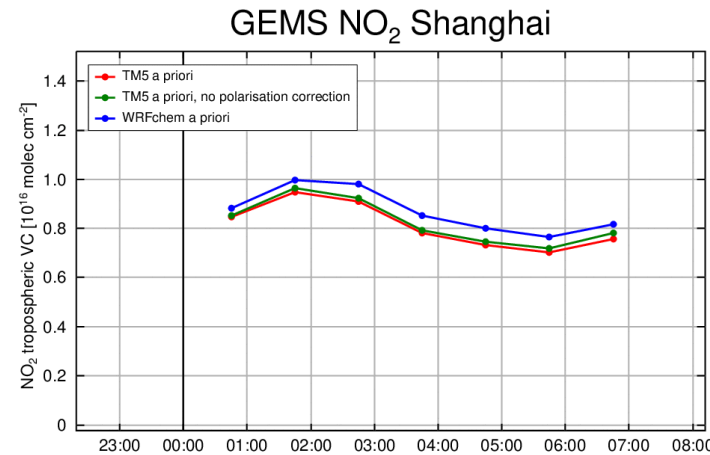

Need to separate **observation related effects** from **atmospheric composition effects**

Summary and Outlook

- The Korean GEMS satellite provides high resolution data over Asia with hourly resolution
- The S4 NO₂ breadboard algorithm was successfully applied to GEMS and TROPOMI data
- Excellent agreement is found between GEMS and TROPOMI data if cloud correction is not used
- Good long-term stability and consistency
- Large and variable diurnal profiles of NO₂ are observed over source regions in Asia
- Time of maximum NO₂ columns shows many instrument and observation related patterns

A big **Thank You** to the GMAP and GEMS teams for providing data, financial and scientific support, and an excellent collaboration atmosphere!

GEMS NO₂ diurnal variation: Sensitivity

- Correction of **polarisation** dependency has small impact only
- Change of **a priori** to high resolution WRFchem increases values and for some locations also diurnal variation
